## **Bacterial Disease Mechanisms: An Introduction to Cellular ...**

Bacteria cause disease by secreting or excreting toxins (as in botulism), by producing toxins internally, which are released when the bacteria disintegrate (as in typhoid), or by inducing sensitivity to their antigenic properties (as in tuberculosis).

This introductory cellular microbiology textbook describes how bacteria cause human diseases. It differs from other books on the subject by describing disease mechanisms in terms of the way in which bacteria subvert normal host cell functions and defence systems to ensure their own survival.

Tuberculosis (TB) is a highly infectious disease caused by *Mycobacterium tuberculosis* (Mtb), which often parasitizes in macrophages. This study is performed to investigate the bactericidal effect and underlying mechanisms of low-frequency and low-intensity ultrasound (LFLIU) combined with levofloxacin-loaded PLGA nanoparticles (LEV-NPs) on *M. smegmatis* (a surrogate of Mtb) in macrophages.
