This numerical seepage model is employed to the seepage analysis of the hydraulic tunnel surrounding rocks in the Yangjiang pumped-storage power station, which is the highest water pressure tunnel under construction in China. Moreover, the permeability of the surrounding rocks under high water pressure is determined

water levels on the two sides of the structure such as a dam or a sheet pile as shown in Fig. 1. Whenever there is seepage (e.g., beneath a concrete dam or a sheet pile), it is often necessary to estimate the quantity of the seepage, and permeability becomes the main parameter here. dam sheet pile hL h L soil seepage

The velocity vectors, iso-potential lines, flow paths and water table are illustrated. The model calculated the amount of groundwater inflow and height of the seepage face around the pit wall equal to 2.17 m<sup>3</sup>/s and 77 m respectively. 3.

Freeze and Witherspoon (1966) generated many numerical flow nets in their theoretical study of regional groundwater flow. The method was in wide use much earlier in the agricultural drainage field (see Luthin and Gaskell, 1950) and in the derivation of seepage patterns in earth dams (Shaw and Southwell, 1941).

If the seepage flow is kept constant along the  $x$ -axis, the mean water levels of the seashore and foundation pit are  $h_1$  and  $h_2$ , respectively.  $h_1$  is the height of the phreatic line when  $x=0$ , as shown in Figure 1. The initial condition of the model could be derived according to the gradually varied seepage flow equation with a flat slope as follows [21, 22]: Here,  $k$  is the permeability coefficient,  $h$  represents ...

Judson W. Harvey, Brian J. Wagner, in Streams and Ground Waters, 2000. 3. Direct Measurement of Water Fluxes across Streambeds. Seepage meters are increasingly being used in streams to determine hydrologic fluxes across the streambed (Jackman et al., 1997; Wroblicky et al., 1998).
